7.0 GENERIC MESSAGE QUERIES

7.1 DESCRIPTION

Generic transactions provide users with the capability to directly query unique databases connected to the Nlets system. For example, some state files may not be of nationwide value or availability and hence an 'all inclusive' message key has not been created for query purposes.

However states in close proximity to one another may choose to implement the ability to directly query each others databases. The LQ message key allows this transaction to be sent and received via Nlets.

See Appendix A, Section 7.0 for XML formats and examples.

See Appendix B, Section 7.0 for Native formats and examples.

7.2 INQUIRY MESSAGE KEY

LQ	Concealed Weapon Permit Holder Query
----	--------------------------------------

7.3 INQUIRY DESTINATION LIMITATIONS

LQ Single destination only via two-character code or ORI

7.4 DATA ELEMENTS

7.4.1 LQ DATA ELEMENTS

There are no specific formats to allow automated access and response for generic transactions. All design and implementation is the responsibility of the participating entity.

Two additional characters (letters or numbers) may be added to the LQ message key immediately following the Q. This multiple different transaction within a given system.

Field	MFC
Message key	None
ORI of requesting agency	None
Destination code	None
Fixed field prefix denoting beginning of message	TXT
Additional fields and MFC's dictated by the design of participating entities.	

7.4.2 LQ INQUIRY FORMATS

LQ• ORI•__•TXT• unique elements of each transaction

	Mandatory fields
	Optional fields

7.4.3 EXAMPLE OF POTENTIAL USE OF LQ TRANSACTION

New York may implement a gun registration file. New Jersey may benefit by having access to this data, but implementation of such capability nationwide is not feasible. Therefore, representatives from New Jersey and New York coordinate an effort to allow access through Nlets LQ transaction.

Nlets will not edit the text of the message so New Jersey may include whatever information is required by New York.
